Shelf Mockup

A Midterm Course Requirement in Applications Development and Emerging
Technologies

2nd Semester AY2026-2027

In Partial Fulfillment
of the Requirements for the Degree
School of Computing

Submitted to:
PROF. STOLK, TJAKOEN A.
6ADET Instructor

Submitted by:
EVANGELISTA, VINCE JERWYN E.

What Changed and Why

The wireframe established the core inventory flow. The mockup adds the interaction detail, status handling, and item-management paths needed to make that flow usable as a complete product.

Screen or element	The wireframe assumed	The mockup shows	What I will change
Entry flow and scanning	A user starts directly in a scanning screen with a camera action.	A sign-in screen leads to Home and a dedicated Scan area with separate modes for new spaces, existing sections, and returns.	Keep the scan-first concept, but add the sign-in, Home, and Scan entry states so the user can choose the correct task before opening the camera.
Room scan results	The room scan is followed by a simple confirmation dialog listing detected spaces.	Room Scan includes progress feedback, a completion summary, and a Detected Spaces list with Confirmed and Review states.	Add scan progress and explicit review/confirmation states so uncertain detections can be checked before setup.
Space setup	Inventory hotspots lead to a generic shelf, cabinet, or drawer configuration step.	The user chooses from named layouts such as one section, two sections, three sections, four shelves, drawers, or a custom layout, then selects one section at a time.	Replace the generic configuration step with a layout chooser and section-by-section setup flow.
Item capture	The wireframe shows one scanning screen and an Add Items action for a selected section.	The mockup provides guided section scanning, visible item labels, a scan-progress message, and a separate Review Items step.	Add camera guidance, detected-item labels, progress feedback, and a review step before items are saved.

HOLY ANGEL UNIVERSITY

Screen element	The wireframe assumed	The mockup shows	What I will change
Inventory structure and overview	The wireframe shows a section with items and a basic item-detail view.	Container Overview makes the hierarchy visible: workspace, container, section, and item, with Full, Partial, and Empty states for sections.	Make the hierarchy explicit and show section occupancy so users can understand where items belong at a glance.
Search	Search returns an item name and a section location.	Search includes filters, a result summary, the item image, its home location, and a separate View Item Details action.	Keep search lightweight, but add filters and location context so the result is useful before opening the detail screen.
Item lifecycle actions	The wireframe focuses on viewing item details and does not define the checkout, return, or move flows.	The mockup adds dedicated Check Out Item, Return an Item with section QR scanning, and Move an Item screens while retaining the saved location.	Add these task-specific paths and preserve item status and location information after each action.
Rescan and remap	The wireframe does not define what happens when furniture or room layout changes.	Rescan and Remap compares the previous container with a new detection, shows match confidence, and offers Keep Match or Choose Different.	Add a remapping decision step that protects existing section names, inventory records, and location history when the room changes.
